DevOps and site reliability engineer (M.S., Computer Science) with 2+ years building and running distributed systems on AWS: Python tooling, multi-region infrastructure as code, and fault-injection testing in a Kubernetes lab.

## EXPERIENCE

**Cyber Nirvana LLC** · Client: Amtrak — Aug 2024 – Present
*DevOps & Site Reliability Engineer* · Enterprise APIs on AWS across four accounts, each with a primary and a DR region

- Wrote a Python tool that validates the log data pipeline end to end, correlating delivery metrics across CloudWatch Logs, Amazon Data Firehose, S3 backup and Dynatrace for multiple AWS accounts and regions, replacing a manual check.
- Built a new Application Load Balancer with AWS CDK, Terraform and CloudFormation (HTTPS listeners and certificates, target groups, health checks, routing rules, security groups, DNS) that now exposes an existing application externally.
- Worked on 130 of the 194 enterprise applications and APIs migrated from MuleSoft to AWS: executed Stage and Production deployments, submitted configuration PRs, validated ECS tasks and logs, added Kibana Watcher alerts, and created rollback-related PRs and supported production cutovers and rollbacks.
- Updated AWS CDK configurations for disaster-recovery SQS settings, modified IAM permissions and production application properties, and validated application configurations across the primary and DR regions.
- Own builds, deployments and on-call for 10 applications, Dev through Production, as the team's DevOps engineer and SRE, across ECS/Fargate services, Lambda functions, Step Functions workflows and scheduled jobs.
- Investigated 30+ production incidents with application, database and network teams, from ECS task failures and connection-pool timeouts to downstream dependency failures, tracing requests via API Gateway, VPC Link, NLB and ECS.
- Designed Dynatrace alert matrices (thresholds, severities, notification and response levels), configured alerts, added metric keys via GitHub, validated alerts by reproducing error scenarios, and wrote OpenPipeline DQL log-parsing rules.
- Raised 140+ change requests and ran releases in CodePipeline, CodeBuild, CodeDeploy and Jenkins. When an aborted Jenkins run left an MSK cluster undeleted, found why it was stuck, deleted it and cleaned up leftover resources.

## PROJECTS

**KubeReliability** · Python, FastAPI, Kubernetes, Prometheus, Grafana — *Personal project, in progress*

- Built two instrumented Python (FastAPI) services with 13 unit tests and deployed them to a three-node kind cluster with probes, HPA, PodDisruptionBudgets, RBAC, NetworkPolicies, Prometheus and a 16-panel Grafana dashboard.
- Kept liveness checks local and readiness dependency-aware, so a dependency outage removes API pods from traffic instead of restarting them; scripted 8 fault-injection scenarios that verify failure signals and recovery.

**Portfolio CI/CD Pipeline** · GitHub Actions, Google Cloud, Firebase Hosting, TypeScript — *Personal project, live*

- Built GitHub Actions CI/CD for abhiramkotari.com: lint and type-checked builds plus a 7-day Firebase preview for every PR, production deploys on merge, and keyless Google Cloud auth through OIDC and Workload Identity Federation.

## TECHNICAL SKILLS

| | |
|---|---|
| **Languages & OS** | Python, Bash, Linux |
| **AWS** | ECS/Fargate, Lambda, Step Functions, API Gateway, S3, SQS, Data Firehose, MSK, IAM, ALB/NLB |
| **IaC & CI/CD** | AWS CDK, Terraform, CloudFormation, Jenkins, CodePipeline, CodeBuild, CodeDeploy, Docker |
| **Observability** | Dynatrace (DQL, OpenPipeline, alerting), CloudWatch Logs Insights, Elasticsearch/Kibana (Watcher) |

## EDUCATION

**M.S., Computer Science** · University of Central Missouri — Aug 2023 – Dec 2024
**B.Tech, Computer Science & Engineering** · JNTU Vizianagaram — Aug 2019 – Apr 2023
**Relevant coursework:** Data Structures and Algorithms (B.Tech and M.S.)
